

Aim - To create scenarios for the given problem

Theory -

- A user scenario is the Fictitious story of a user's accomplishing an action or a goal via a product
- It focuses on a user's motivation and documents the process by which the user might see a design
- User scenarios help designers understand what motivates users when they interact with a design - a useful consideration for ideation and usability testing
- User scenarios can be used in the ideation phase of a design project.
- This is where visualizing how a user will use a product or service will help generate design ideas
- At such an early stage, the feasibility these scenarios offer to a designer imagination is immense - a ~~for~~ bonus that can expand a design potential to be highly versatile and even transcend market use

Good user scenarios provide context and detail in order to be as accurate and relatable as possible. So as to represent target users in the truest form possible, user scenarios need to be based on some form of insight into a research done with real or prospective users.

Teacher's Sign.: _____

User Scenarios:

- 1) Two Friends meeting after few days
- 2) one friend give insight about food blog
- 3) Information about the site is communicated

Conclusion - User Scenarios were successfully implemented for chosen problem statement

Teacher's Sign.: _____
